

Digital Motion X-ray Cervical Spine

1. In the neutral lateral projection: Shows reversal of the cervical lordosis, with the apex of the reversal at the level of C4-C5. There is disc narrowing and spurring at C4-C5 and C5-C6.

The integrity of the cervical lordosis and overall condition of the cervical spine is evaluated. The loss of the cervical lordosis may be a result of damage to the posterior longitudinal, capsular or interspinous ligaments.

Neutral lateral projection
